RUBUS SIERRAE (ROSACEAE): A NEW SPECIES FROM CHIHUAHUA

Joseph E. Laferrière

P.O. Box 23034, Providence, Rhode Island 02903 U.S.A.

ABSTRACT

Rubus sierrae is a new species of the Rosaceae from the Sierra Madre Occidental of Chihuahua, México. It is distinguished by its serrate sepals and ternate leaves.

RESUMEN

Rubus sierrae es nueva especie de las Rosáceas de la Sierra Madre Occidental de Chihuahua, México. Se distingue por sus sépalos serratos y sus hojas ternatas.

KEY WORDS: *Rubus*, blackberry, raspberry, mora, Chihuahua, Mountain Pima

Laferrière (1994) cited a specimen of the genus *Rubus* from Chihuahua, México, as "*Rubus arizonensis* Focke *vel aff.*" Closer examination indicates that the specimen differs significantly from this and all other known species. It is therefore described as a new member of the Rosaceae.

Rubus sierrae J.E. Laferrière, *spec. nov.* TYPUS: MEXICO. Chihuahua: Municipio Temósachi, in maple grove by banks of Río Yepachi, 4 km S of Nabogame, 28° 20' N, 108° 30' W, 1600 m, 28 Jul 1988, J.E. Laferrière 1579 (HOLOTYPUS: ARIZ; Isotypi: HUMO, MEXU).

Rubus arizonensis auct non Focke, Phytologia 77:128. 1994.

Rubus sp. 1 A. Harlan & P. Jenkins, in P.S. Martin *et al.*, Gentry's Rio Mayo Pl., p. 426. 1998.

Folia pinnate ternate; foliola lanceolata, serrata, non lobata. Sepala lineara, proxime alba et pubenta, distale viridia et serrata.

Shrub erect, 1 m tall, pubescent; trichomes white, unbranches, sometimes with a yellowish gland at the base. Stems yellowish green, sparsely armed; prickles slightly curved, 1-4 mm long, slender at the base, tapering toward the tip, older stem prickles yellowish below, reddish in the middle, yellowish toward the tip. Leaves pinnately ternate; stipules filiform, pubescent, 0.5 cm long; petioles 2.0-3.5 cm long, yellowish green, pubescent, sparingly armed; leaflets lanceolate, biserrate, sparingly puberulent, green above, slightly lighter green below, bearing a few small prickles along the costa below; lateral leaflets 3.5-5.0 cm long, 1.5-2.7 cm wide; terminal leaflets 3.5-5.0 cm long, 2.5-3.0 cm wide, borne on a stalk 0.6-0.8 cm long. Flowers solitary, terminal on a leafy lateral branch; sepals nearly linear but slightly sinuate, constricted in the middle, 0.9-1.3 cm long, 0.2-0.3 cm wide, not reflexed, the proximal half linear, pale green, densely pubescent with many short hairs, the margins of the proximal half entire, the distal portion darker green, sparingly pubescent, bearing 3-5 pairs of serrations up to 1.0 mm deep; petals 0.5 cm long, white. Fruit and seeds unknown.

Named in memory of Dionysia Sierra Cruz (1985-87) of Nabogame.

Because of the lack of fruits, it is impossible to discern with certainty the plant's true relationships. Subgenera in the genus are delimited largely by fruit characters (Bailey 1940-45). The distinctive sepals, however, leave little doubt that it is indeed a new species. The vast majority of North American species of *Rubus* have entire, uniformly colored sepals. The solitary flowers are also unusual; most species of the genus have many-flowered panicles. The cultivated European species *R. laciniatus* Willd., naturalized in many parts of North America, has serrate, bicolored sepals like those of *R. sierrae*, but its sepals bear prickles. The leaves of *R. laciniatus* are generally deeply divided. *Rubus pedatus* Smith, which ranges from Alaska to Idaho and Oregon, has dentate sepals, but this is a small, mat-forming species with 5-foliate leaves. *Rubus neomexicanus* A. Gray, *R. parviflorus* Nutt, and *R. trilobus* Seringe all bear two-tone sepals sometimes with a hint of serration, but all these species are entirely unarmed and bear simple, palmately lobed leaves. In vegetative characters, *R. sierrae* resembles *R. arizonensis*, but these are readily distinguished by the former's smaller, slenderer spines of nearly uniform thickness. The spines of *R. arizonensis* are swollen at the base and taper very gradually toward the tip.

The type locality of *Rubus sierrae* was included in Harlan & Jenkins's (1998) treatment of *Rubus* of the Río Mayo region. They list three named species; the description above of *R. sierrae* creates a fourth named species in the region. A key to the four is given below.

- Spines stout at base. *Rubus arizonensis* Focke
- Spines slender at base.
 - Sepals bicolored, proximally entire and with white pubescence, distally green and the margins serrate; flowers solitary. *R. sierrae* J.E. Laferr.
 - Sepals uniformly colored, the margins entire throughout; flowers corymbose
 - Leaves bicolored, abaxially glaucous, adaxially dark green.
 - *R. leucodermis* Dougl.
 - Leaves uniformly dark green on both sides. *R. humistratus* Steud.

Rubus sierrae occurs in a riparian forest dominated by *Acer grandidentatum* Nutt. and *Cupressus lusitanica* Mill. This is an unusual habitat for the region, much moister

than the surrounding pine-oak forest. The Mountain Pima inhabitants of Nabogame refer to the plant as "mora." This is the same name they apply to the cultivated mulberry, *Morus rubra* L.

Huntsville, Texas 77341 U.S.A.

ABSTRACT

A summary of taxonomic citations found in *Phytologia* is made in order to facilitate searching for references to particular plants in the journal. The taxon index for the first volume of *Phytologia* included entries at the species level and above. However, indices for volumes 2 through 67 included entries only at the genus level and above. The present summary of taxon citations includes all citations from volumes 36 through 40. Previous summaries have included indices for volumes 2 through 35. Later summaries will include the remaining volumes through volume 67. Boldface entries indicate that the taxon was originally described or a new combination produced on the indicated page.

KEY WORDS: taxonomic index, new taxa, nomenclature

Taxonomic citations from volumes 36 through 40 are listed alphabetically. Boldface entries indicate that the taxon was originally described or a new combination produced in volumes 36 through 40 of *Phytologia*.

NEW NAMES IN THIS ISSUE OF PHYTOLOGIA

As a result of the International Botanical Congress in Tokyo in 1993, the International Association of Plant Taxonomy has been tasked with exploring the feasibility of registration of plant and fungi names. In accordance with terms of the pilot implementation of the registration concept, new names and combinations produced in this issue of PHYTOLOGIA are listed below.

New name or combination	Page Number
<i>Rubus sierrae</i> J.E. Laferrière	169

New York Botanical Garden Library

3 5185 00288 4243

Information for Authors

Articles from botanical systematics and ecology, including biographical sketches, critical reviews, and summaries of literature will be considered for publication in PHYTOLOGIA. Manuscripts may be submitted either on computer diskette, or as clean typescript. Diskettes will be returned to authors after action has been taken on the manuscript. Diskettes may be 5.25" or 3.5" and may be written in any IBM or Macintosh compatible format. Typescript manuscripts should be single spaced and will be read into the computer using a scanner. The scanner will read standard type fonts but will not read dot matrix print. Manuscripts submitted in dot matrix print cannot be accepted. Use underscore (not italics) for scientific names. Language of manuscripts may be either English or Spanish. Figures will be reduced to fit within limits of text pages. Therefore, figures should be submitted with internal scales. Legends for figures should be included in figures whenever possible. Each manuscript should have an abstract and key word list. Specimen citations should be consistent throughout the manuscript. Serial titles should be cited with standard abbreviations. References cited only as part of nomenclatural summaries should not appear in Literature Cited. Nomenclatural work should include one paragraph per basionym and must provide proper (as defined by the current *International Code of Botanical Nomenclature*) citation of sources of epithets and combinations.

Authors should arrange for two workers in the appropriate field to review the manuscript before submission. Copies of reviews should be forwarded to the editor with the manuscript. Manuscripts will not be published without review.

Cost of publication is currently \$13.00 US per page for publication without reprints. Publication with 100 reprints is provided for \$18.00 US per page, 200 reprints for \$21.50 US per page. Page charges are due with manuscript and no paper will be published before payment is received in full. Reprints must be ordered and paid for in advance. Page charges will be determined on the basis of a typeset page. Title page should include title, authors(s) name(s), and address(es). No extra charge is made for line drawings provided they conform to limitations of size and proportion for normal text. Halftones require an extra charge of \$14.00 US per page at 100%. Enlargement or reductions cost an additional \$6.00 per page.
